

For our paper we chose the farmers market scenario. We focused on having a modern look with a simple design for older generations. The website is named Fresh Roots Market — a fictional community farmers market operating every Saturday at the Downtown Pavilion. The premise is a market that has been running since 2012, features 40+ local vendors sourcing products within a 50-mile radius, and now offers online pre-ordering so customers can guarantee pickup of popular items like sourdough bread and free-range eggs before they sell out.

All form validation on the Pre-Order page is handled by JavaScript, which intercepts the form submission and checks every field before anything is sent — if a field is missing or a quantity is invalid, an error message appears directly below that input and the form stays put. Each required field has its own rule, such as names needing actual text, a date and location needing to be selected, quantities needing to be whole numbers, and at least one item needing to be added to the order. As the user adjusts quantities, the page automatically calculates each item's line total, adds them up, applies an 8% tax, and displays the running grand total in real time without any button press needed. Once everything passes validation, a confirmation message is built and displayed on the page showing the order details, and the form resets itself back to zero.

Home: The landing page features a full-height hero section with animated product cards, a Featured Products grid highlighting five key items and info on the organization.

Our Story: The About page tells the market's origin story through a hero banner, a two-column story grid with staggered info cards, and three-column about values.

Shop: The product listing page displays all six available items. Each card shows the vendor name, a badge such as Bestseller, In Season, or Low Stock, the price, and a link to that product's detail page.

Product Detail Pages Each product has its own dedicated detail page featuring a large emoji product image, vendor name, badge, price, description, and a Pre-Order button. A three-tab info panel lets users browse the info on the item.

Pre-Order : The interactive pre-order form is divided into three sections: Customer Information Choose Your Items and an order summary showing.

Checkout: A basic checkout form page collecting the customer's full name, email address, shipping address fields, and payment method via a dropdown. It submits to <httpbin.org> for demonstration purposes.

Fin completed product pages, index and shop pages, troy about and product pages and brandon completed the checkout pages and a majority of css.
